BLUEPRINT — Week 10 — Team (name pending)

Working fusion draft based on three supplied briefs; not a record of a completed five-person vote.

FACTS WE AGREE ON (across three available briefs)

• Seller-side optimization prioritizes conversion; the buyer needs independent help evaluating constraints.

• Current tools can support a transparent pre-purchase checklist and budget calculations, but cannot infer complete debts or guarantee good decisions.

• Mexico requires Spanish-first, low-friction, mobile workflows; cash expenses, irregular income and fragmented BNPL data complicate imported solutions.

• The buyer must keep control: explanations, uncertainty, override and no merchant commissions.

• The 38–40% fashion-return figure and claimed causal link to personalization require independent verification.

BETS WE CHOSE (provisional; dissent noted)

• Fuse Regret Prevention with Debt Guardrails in one buyer-side checkpoint, PAUSA MX. USER favors regret prevention as the primary outcome; OPERATOR favors debt guardrails as the primary entry point.

• Start with clothing purchases and optional manual installment inputs; avoid automatic screen interception or cross-provider debt claims. MONEY proposed a broader buyer-agent “firewall”; feasibility remains untested.

• Measure informed choices and 30-day regret, not conversion or purchases blocked. No team vote yet; Technologist and Adversary positions missing.

PRIMARY VACUUM

REGRET PREVENTION — PAUSA MX: a buyer-controlled pause before purchase, with debt guardrails as a secondary module. Proposed selection, not ratified by the full team.

THE CONDITIONS

1. Buyer-first: no retailer commissions, product rankings for sellers or checkout incentives.

2. Show the math and evidence; label unknown costs, merchant claims and missing BNPL obligations; never invent confidence.

3. Accessible Mexican pilot: simple Spanish, manual cash/income entry, no mandatory bank connection or credentials.

4. SHADOW CLAUSE: explainable, dismissible advice; no automatic blocking, behavioral manipulation or hidden happiness score; the buyer always decides.

5. Privacy by default: minimal collection, deletion controls and 30-day expiry for purchase history unless explicitly saved.

6. Test with consent: interview real returners and run a small pilot; measure regret after 30 days and record harms or ignored warnings.

DECLARATIONS (proposed; members must confirm)

• USER → build a three-question clothing pre-purchase checklist and interview protocol; honors conditions 4 and 6.

• MONEY — Carlos Arakindji → prototype a transparent “cost of buying now” comparison; honors conditions 1 and 2.

• OPERATOR — Miguel Bravo → build manual BNPL schedule and conservative cash-left view; honors conditions 2 and 3.

• TECHNOLOGIST → no brief or declaration received; guest seat or member confirmation required.

• ADVERSARY → no brief or declaration received; guest seat or member confirmation required.

DISSENT PRESERVED

USER disputes that returns alone prove personalization caused worse decisions. OPERATOR also rejects causal certainty and prefers debt guardrails; MONEY argues a stronger predatory-model thesis and broader agent. The team has not resolved scope, causal claims or feasibility. No live collision votes or 60-second pressure tests are documented.
